CAYLEY-HAMILTON

Theorem (Cayley-Hamilton)

A matrix $\mathbf{M} \in \mathbb{R}^{n,n}$ satisfies its own characteristic equation.

A characteristic equation can be written as $\lambda^n + a_{n-1}\lambda^{n-1} + ... + a_0 = 0$, meaning that we can write:

$$\mathbf{M}^{n} + a_{n-1}\mathbf{M}^{n-1} + \dots + a_{0}\mathbf{I} = 0$$
 (1)

Meaning that \mathbf{M}^n is a linear combination of \mathbf{M}^{n-1} , \mathbf{M}^{n-2} , ..., \mathbf{I} .

CONTROLLABILITY OF DISCRETE LTI

Consider discrete LTI:

$$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \tag{2}$$

Assume the initial state is \mathbf{x}_1 . Then we can deduce that:

$$egin{aligned} \mathbf{x}_2 &= \mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1 \ \mathbf{x}_3 &= \mathbf{A}\mathbf{x}_2 + \mathbf{B}\mathbf{u}_2 = \mathbf{A}(\mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1) + \mathbf{B}\mathbf{u}_2 \ \mathbf{x}_4 &= \mathbf{A}\mathbf{x}_3 + \mathbf{B}\mathbf{u}_3 = \mathbf{A}(\mathbf{A}(\mathbf{A}\mathbf{x}_1 + \mathbf{B}\mathbf{u}_1) + \mathbf{B}\mathbf{u}_2) + \mathbf{B}\mathbf{u}_3 \ &\dots \ \mathbf{x}_{n+1} &= \mathbf{A}^n\mathbf{x}_1 + \dots + \mathbf{A}^{n-k}\mathbf{B}\mathbf{u}_k + \dots + \mathbf{B}\mathbf{u}_n \end{aligned}$$

CONTROLLABILITY MATRIX

Equation $\mathbf{x}_{n+1} = \mathbf{A}^n \mathbf{x}_1 + ... + \mathbf{A}^{n-k} \mathbf{B} \mathbf{u}_k + ... \mathbf{B} \mathbf{u}_n$ can be re-written as:

$$\mathbf{x}_{n+1} - \mathbf{A}^n \mathbf{x}_1 = \begin{bmatrix} \mathbf{B} & \mathbf{A}\mathbf{B} & \mathbf{A}^2 \mathbf{B} & \dots & \mathbf{A}^{n-1} \mathbf{B} \end{bmatrix} \begin{bmatrix} \mathbf{u}_k \\ \mathbf{u}_{k-1} \\ \mathbf{u}_{k-2} \\ \dots \\ \mathbf{u}_1 \end{bmatrix}$$
(3)

Notice that in order for the system to go from \mathbf{x}_1 to \mathbf{x}_{n+1} , vector $\mathbf{x}_{n+1} - \mathbf{A}^n \mathbf{x}_1$ needs be in the column space of $\mathcal{C} = \begin{bmatrix} \mathbf{B} & \mathbf{A}\mathbf{B} & \dots & \mathbf{A}^{n-1}\mathbf{B} \end{bmatrix}$.

Since \mathbf{x}_{n+1} can be anything, and \mathbf{x}_1 might be equal to zero (among other possibilities), we should require that all vectors in \mathbb{R}^n need to be in the column space of \mathcal{C} , meaning \mathcal{C} needs to be full rank.

CONTROLLABILITY CRITERION

Controllability

For a system $\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i$, where $\mathbf{x} \in \mathbb{R}^n$, if the matrix $\mathcal{C} = \begin{bmatrix} \mathbf{B} & \mathbf{A}\mathbf{B} & \dots & \mathbf{A}^{n-1}\mathbf{B} \end{bmatrix}$ is full row rank (i.e. rank(\mathcal{C}) = n), any state can be reached, which means that the system is controllable.

CONTROLLABILITY MATRIX RANK

If you are interested why the controllability matrix for not include more columns, like \mathbf{A}^n , Consider the following: The controllability matrix can be written as

$$C = \begin{bmatrix} \mathbf{I} & \mathbf{A} & \dots & \mathbf{A}^{n-1} \end{bmatrix} \begin{bmatrix} \mathbf{B} & \mathbf{0} & \dots & \mathbf{0} \\ \mathbf{0} & \mathbf{B} & \dots & \mathbf{0} \\ \dots & \dots & \dots & \dots \\ \mathbf{0} & \mathbf{0} & \dots & \mathbf{B} \end{bmatrix}$$
(4)

meaning that the rank of C depends only on matrix $[I \ A \ ... \ A^{n-1}]$. Adding to it columns A^n does not change the rank, as A^n is a linear combination of the other columns, as we proved in the previous slide.

Observability of Discrete LTI

Consider discrete LTI:

$$\begin{cases} \mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \\ \mathbf{y}_i = \mathbf{C}\mathbf{x}_i \end{cases}$$
 (5)

And an observer:

$$\hat{\mathbf{x}}_{i+1} = \mathbf{A}\hat{\mathbf{x}}_i + \mathbf{B}\mathbf{u}_i + \mathbf{L}(\mathbf{y}_i - \mathbf{C}\hat{\mathbf{x}}_i)$$
 (6)

Remember that we can define observation error $\mathbf{e}_i = \hat{\mathbf{x}}_i - \mathbf{x}_i$ and write its dynamics:

$$\mathbf{e}_{i+1} = \mathbf{A}\mathbf{e}_i - \mathbf{L}\mathbf{C}\mathbf{e}_i \tag{7}$$

Dual system (which is stable if and only if the original is stable), has form:

$$\varepsilon_{i+1} = \mathbf{A}^{\mathsf{T}} \varepsilon_i - \mathbf{C}^{\mathsf{T}} \mathbf{L}^{\mathsf{T}} \varepsilon_i \tag{8}$$

Observability of Discrete LTI

Dual system

Dynamical system $\varepsilon_{i+1} = \mathbf{A}^{\top} \varepsilon_i - \mathbf{C}^{\top} \mathbf{L}^{\top} \varepsilon_i$, we can be represented as:

$$\begin{cases} \varepsilon_{i+1} = \mathbf{A}^{\top} \varepsilon_i + \mathbf{C}^{\top} \mathbf{v}_i \\ \mathbf{v}_i = -\mathbf{L}^{\top} \varepsilon_i \end{cases}$$
 (9)

Controllability matrix of this system is:

$$\mathcal{O}^{\top} = \begin{bmatrix} \mathbf{C}^{\top} & (\mathbf{A}^{\top})\mathbf{C}^{\top} & \dots & (\mathbf{A}^{\top})^{n-1}\mathbf{C}^{\top} \end{bmatrix}$$
 (10)

It is easier to represent this matrix in its transposed form:

$$\mathcal{O} = \begin{bmatrix} \mathbf{C} \\ \mathbf{C}\mathbf{A} \\ \dots \\ \mathbf{C}\mathbf{A}^{n-1} \end{bmatrix}$$
 (11)

Observability of Discrete LTI

Observability criterion

Observability

For a system
$$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i$$
 and $\mathbf{y}_i = \mathbf{C}\mathbf{x}_i$, where $\mathbf{x} \in \mathbb{R}^n$, if the matrix $\mathcal{O} = \begin{bmatrix} \mathbf{C} \\ \mathbf{C}\mathbf{A} \\ \dots \\ \mathbf{C}\mathbf{A}^{n-1} \end{bmatrix}$ is full column rank (i.e.

 $\operatorname{rank}(\mathcal{O}) = n$), observation error can go to zero from any initial position, which means that the system is observable.

MATRIX EXPONENTIAL

Exponential e^a is defined as a series:

$$e^{a} = 1 + a + \frac{1}{2}a^{2} + \frac{1}{6}a^{3} + \dots = \sum_{n=0}^{\infty} \frac{1}{n!}a^{n}$$
 (12)

Matrix exponential $e^{\mathbf{A}}$ is defined as a series:

$$e^{\mathbf{A}} = \mathbf{I} + \mathbf{A} + \frac{1}{2}\mathbf{A}\mathbf{A} + \frac{1}{6}\mathbf{A}\mathbf{A}\mathbf{A} + \dots = \sum_{n=0}^{\infty} \frac{1}{n!}\mathbf{A}^n$$
 (13)

ANALYTICAL SOLUTION TO ODE

An ODE of the form $\dot{x} = ax$ has analytical solution $x(t) = e^{at}x(0)$.

An ODE of the form $\dot{\mathbf{x}} = \mathbf{A}\mathbf{x}$ has analytical solution $\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0)$.

Let us check that this is a solution:

$$\mathbf{x}(t) = \left(\mathbf{I} + \mathbf{A}t + \frac{1}{2}\mathbf{A}\mathbf{A}t^2 + \frac{1}{6}\mathbf{A}\mathbf{A}\mathbf{A}t^3 + \dots\right)\mathbf{x}(0)$$
 (14)

$$\dot{\mathbf{x}}(t) = \left(\mathbf{A} + \mathbf{A}\mathbf{A}t + \frac{1}{2}\mathbf{A}\mathbf{A}\mathbf{A}t^2 + \dots\right)\mathbf{x}(0) \tag{15}$$

$$\dot{\mathbf{x}}(t) = \mathbf{A} \left(\mathbf{I} + \mathbf{A}t + \frac{1}{2} \mathbf{A} \mathbf{A}t^2 + \dots \right) \mathbf{x}(0)$$
 (16)

$$\dot{\mathbf{x}}(t) = \mathbf{A}e^{\mathbf{A}t}\mathbf{x}(0) \tag{17}$$

$$\dot{\mathbf{x}}(t) = \mathbf{A}\mathbf{x}(t) \tag{18}$$

FORCED STATE RESPONSE (LTI) (1)

An ODE of the form $\dot{x} = ax + bu(t)$ also has analytical solution. To find it, we first find the following derivative:

$$\frac{d}{dt}\left(e^{-at}x(t)\right) = e^{-at}\dot{x}(t) - ae^{-at}x(t) \tag{19}$$

Multiplying $\dot{x} = ax + bu(t)$ by e^{-at} we see:

$$e^{-at}\dot{x} = e^{-at}ax + e^{-at}bu(t) \tag{20}$$

$$e^{-at}\dot{x} - e^{-at}ax = e^{-at}bu(t) \tag{21}$$

$$\frac{d}{dt}\left(e^{-at}x(t)\right) = e^{-at}bu(t) \tag{22}$$

$$\int_0^t \frac{d}{d\tau} \left(e^{-a\tau} x(\tau) \right) d\tau = \int_0^t e^{-a\tau} b u(\tau) d\tau \tag{23}$$

FORCED STATE RESPONSE (LTI) (2)

Continuing the derivation:

$$\int_0^t \frac{d}{d\tau} \left(e^{-a\tau} x(\tau) \right) d\tau = \int_0^t e^{-a\tau} b u(\tau) d\tau \tag{24}$$

$$e^{-at}x(t) - x(0) = \int_0^t e^{-a\tau}bu(\tau)d\tau$$
 (25)

$$x(t) = e^{at}x(0) + e^{at} \int_0^t e^{-a\tau}bu(\tau)d\tau$$
 (26)

$$x(t) = e^{at}x(0) + \int_0^t e^{a(t-\tau)}bu(\tau)d\tau$$
 (27)

FORCED STATE RESPONSE (LTI) (3)

State-space equation $\dot{\mathbf{x}} = \mathbf{A}\mathbf{x} + \mathbf{B}\mathbf{u}(t)$ also has an analytical solution:

$$\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0) + \int_0^t e^{\mathbf{A}(t-\tau)}\mathbf{B}\mathbf{u}(\tau)d\tau$$
 (28)

The same can be re-written as:

$$\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0) + e^{\mathbf{A}t} \int_0^t e^{-\mathbf{A}\tau} \mathbf{B}\mathbf{u}(\tau) d\tau$$
 (29)

Controllability, continuous-time (1)

Let us consider matrix exponential $e^{\mathbf{A}t}$ is defined as a series:

$$e^{\mathbf{A}t} = \mathbf{I} + \mathbf{A}t + \frac{1}{2}\mathbf{A}\mathbf{A}t^2 + \frac{1}{6}\mathbf{A}\mathbf{A}\mathbf{A}t^3 + \dots$$
 (30)

Using Cayley–Hamilton we can observe that any powers of \mathbf{A} higher than n can be represented as a linear combination of lower powers. This gives us the following expression:

$$e^{\mathbf{A}t} = \phi_0(t)\mathbf{I} + \phi_1(t)\mathbf{A} + \phi_2(t)\mathbf{A}^2 + \dots + \phi_{n-1}(t)\mathbf{A}^{n-1}$$
 (31)

This allows us to re-write the forced state response:

$$\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0) + \int_0^t e^{\mathbf{A}(t-\tau)}\mathbf{b}u(\tau)d\tau$$

$$\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0) + \int_0^t (\phi_0(t-\tau)\mathbf{I} + \phi_1(t-\tau)\mathbf{A} + \dots + \phi_{n-1}(t-\tau)\mathbf{A}^{n-1})\mathbf{b}u(\tau) d\tau$$

Controllability, continuous-time (2)

$$\mathbf{x}(t) = e^{\mathbf{A}t}\mathbf{x}(0) + \int_0^t \phi_0(t-\tau)\mathbf{b}u(\tau)d\tau$$
$$+ \int_0^t \phi_1(t-\tau)\mathbf{A}\mathbf{b}u(\tau)d\tau + \dots \int_0^t \phi_{n-1}(t-\tau)\mathbf{A}^{n-1}\mathbf{b}u(\tau)d\tau$$

$$\mathbf{x}(t) - e^{\mathbf{A}t}\mathbf{x}(0) = \begin{bmatrix} \mathbf{b} & \mathbf{A}\mathbf{b} & \dots & \mathbf{A}^{n-1}\mathbf{b} \end{bmatrix} \begin{bmatrix} \int_0^t \phi_0(t-\tau)u(\tau)d\tau \\ \int_0^t \phi_1(t-\tau)u(\tau)d\tau \\ \dots \\ \int_0^t \phi_{n-1}(t-\tau)u(\tau)d\tau \end{bmatrix}$$

This shows that if controllability matrix is rank-deficient, it would not be possible to achieve some state from some initial condition.

PBH CONTROLLABILITY CRITERION

There is an alternative way to test if pair (\mathbf{A}, \mathbf{B}) is controllable:

PBH controllability criterion

If for any $\lambda \in \mathbb{C}$, the the matrix $[(\mathbf{A} - \lambda \mathbf{I}), \mathbf{B}]$ has full row rank, then the pair (\mathbf{A}, \mathbf{B}) is controllable.

- If λ is not an eigenvalue of **A**, then $\det(\mathbf{A} \lambda \mathbf{I}) \neq 0$ and the matrix has full row rank.
- If $\det(\mathbf{A} \lambda \mathbf{I}) = 0$ and $\mathcal{V} = \text{null}(\mathbf{A} \lambda \mathbf{I})$, $\dim(\mathcal{V}) = 1$ and $\mathbf{v} \in \mathcal{V}$, meaning λ , \mathbf{v} are eigenvalue and eigenvector of \mathbf{A} , then in order for the criterion to hold the columns fo \mathbf{B} should not all be orthogonal to \mathbf{v} : $\mathbf{v}^{\top}\mathbf{B} \neq 0$.
- If eigenspace V is k-dimensional, the projection of \mathbf{B} onto that eigenspace should also be k-dimensional.
